Outline

Design and result perspectives in RapidMiner.

The Point Dataset Point1.csv:

- Reading the data
- Visual exploration to understand the data and guide the work
- Clustering and the Loop operator: searching for the right k for k-means.

Design and Result Perspectives

Organize your space to store processes, files and results.

Point1:

8 points defined by their x-, y-coordinates.

Reading the Point1-Dataset

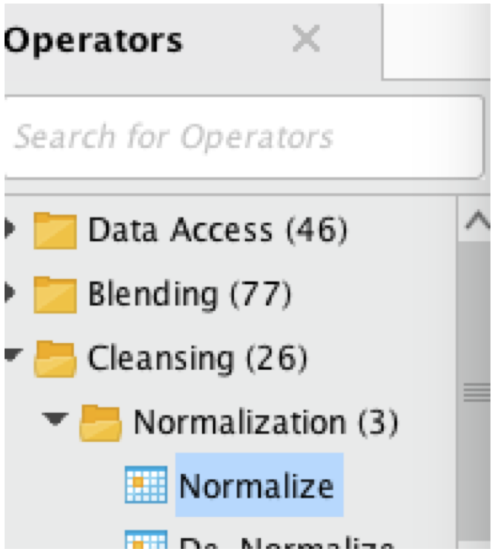
Warning Read Wizard: RapidMiner guesses the type of attributes looking at the first 100 by default.

Metadata:

- Check the order of magnitudes of attributes
- Handy for classical transformations such as:

$$\frac{x - average}{std\ deviation} \qquad \frac{x - min}{range}$$

- Transformation
  can be done inside RM:



Exploring the Point1-Dataset

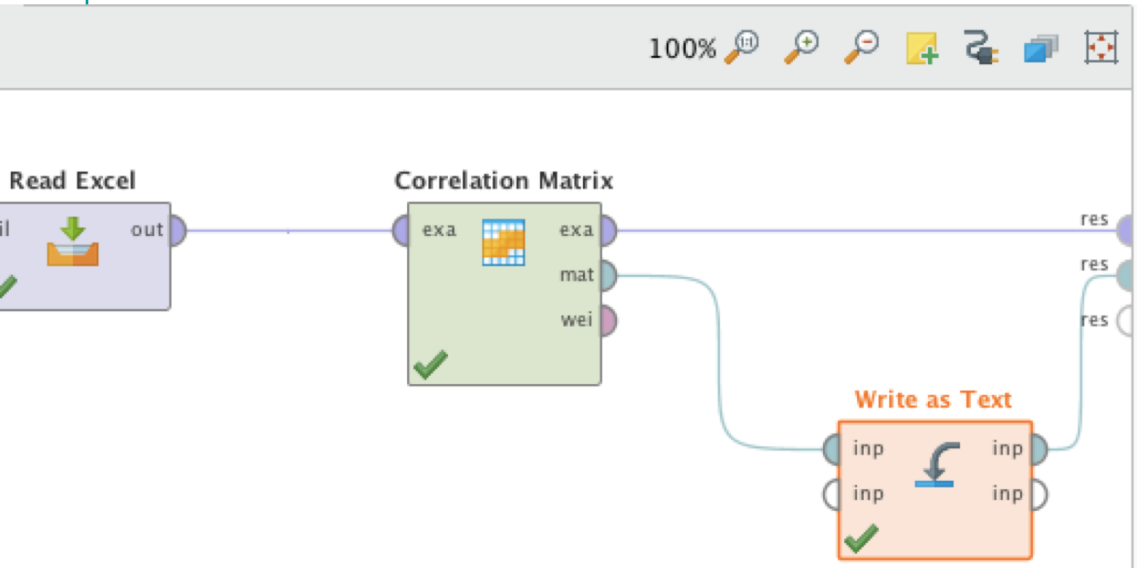
Plots:

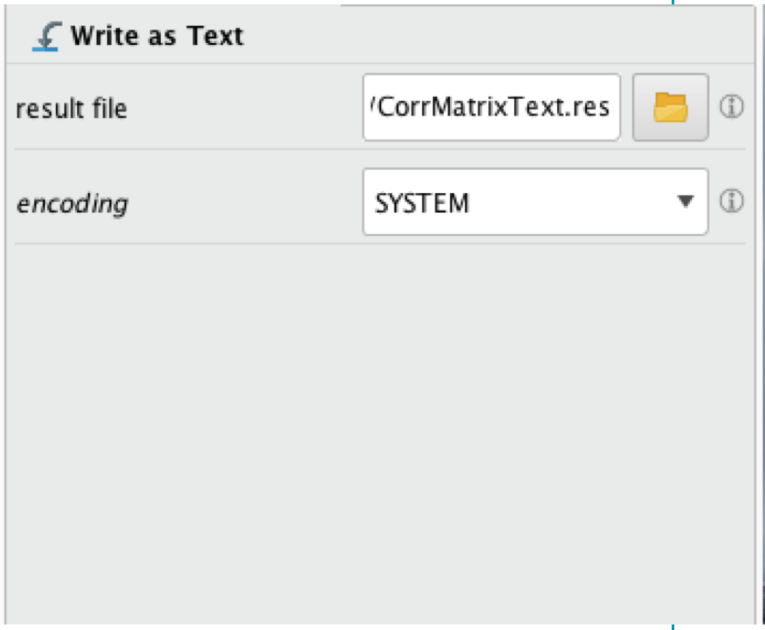
- Histogram / color
- Box plots (quartile)
- Scatter
- and much more...

Correlation Operator:

- Handy: store the matrix with the Write as text Operator

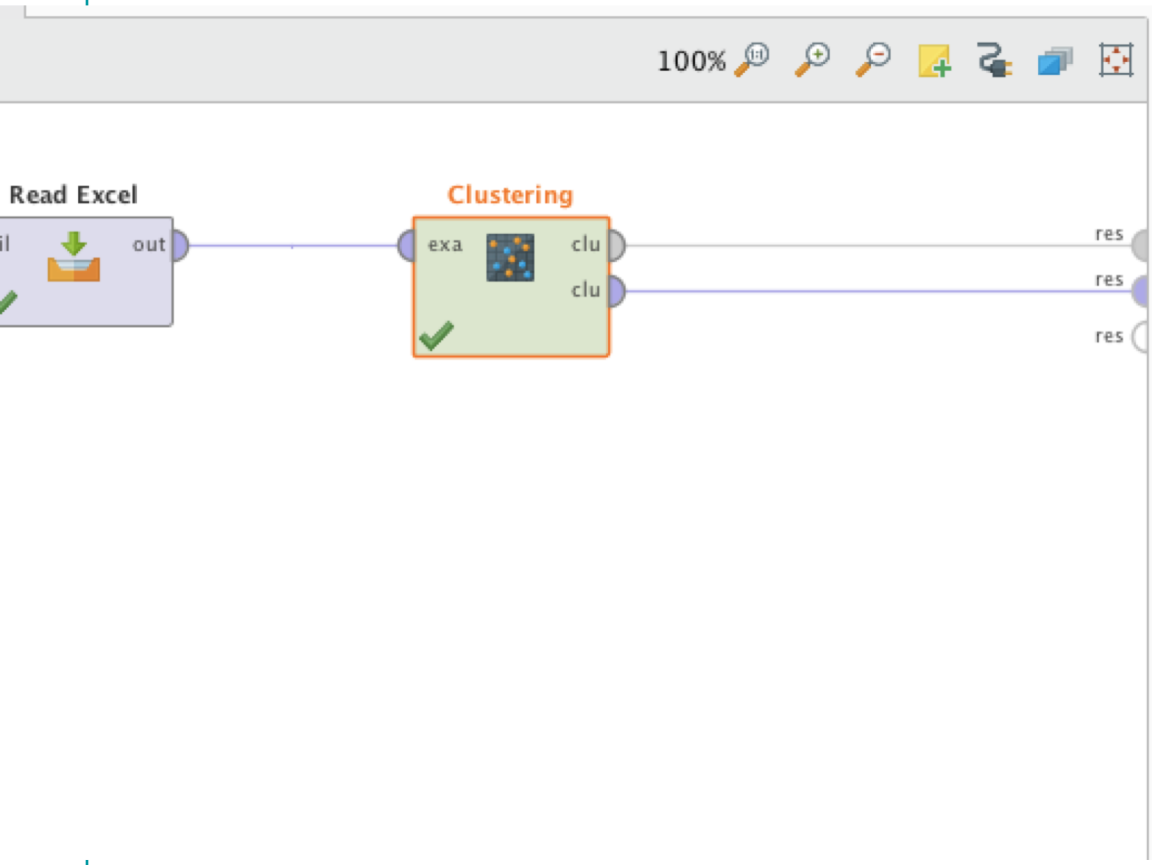
Exploring the Point1-Dataset

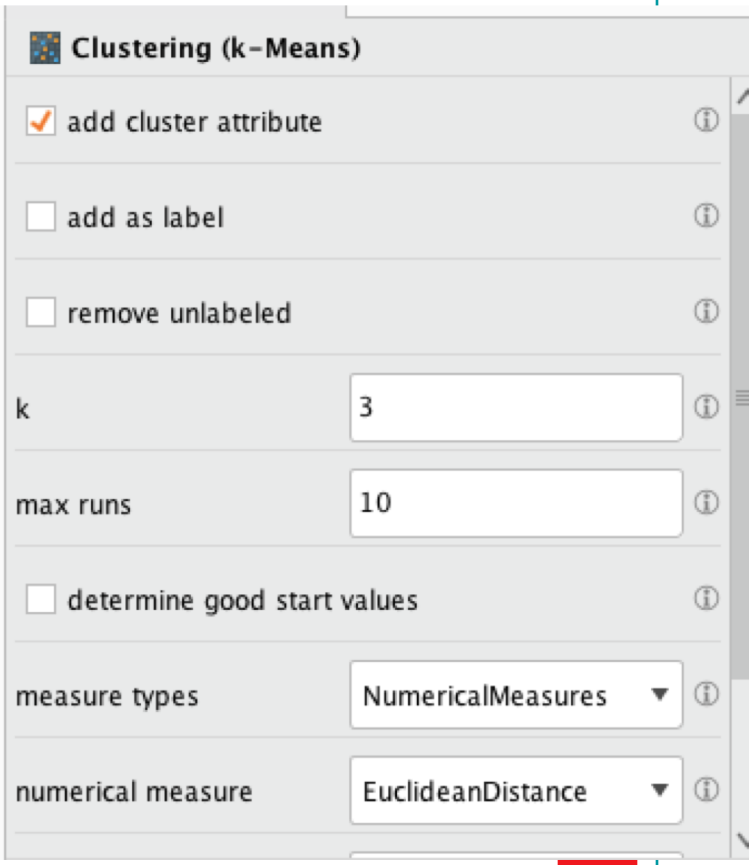




Looking for groups of points with Clustering

K-means / Scatter Plot with Color Column cluster





Looking for groups of points with Clustering

Loop Operator to discover the right k:

- Warning: skip the first port per inside the loop operator to get the results
- Handy: Log Operator to plot average within distance cluster or Davies Bouldin against k. Edit the parameters you want to plot, k and avg_within_distance for instance.

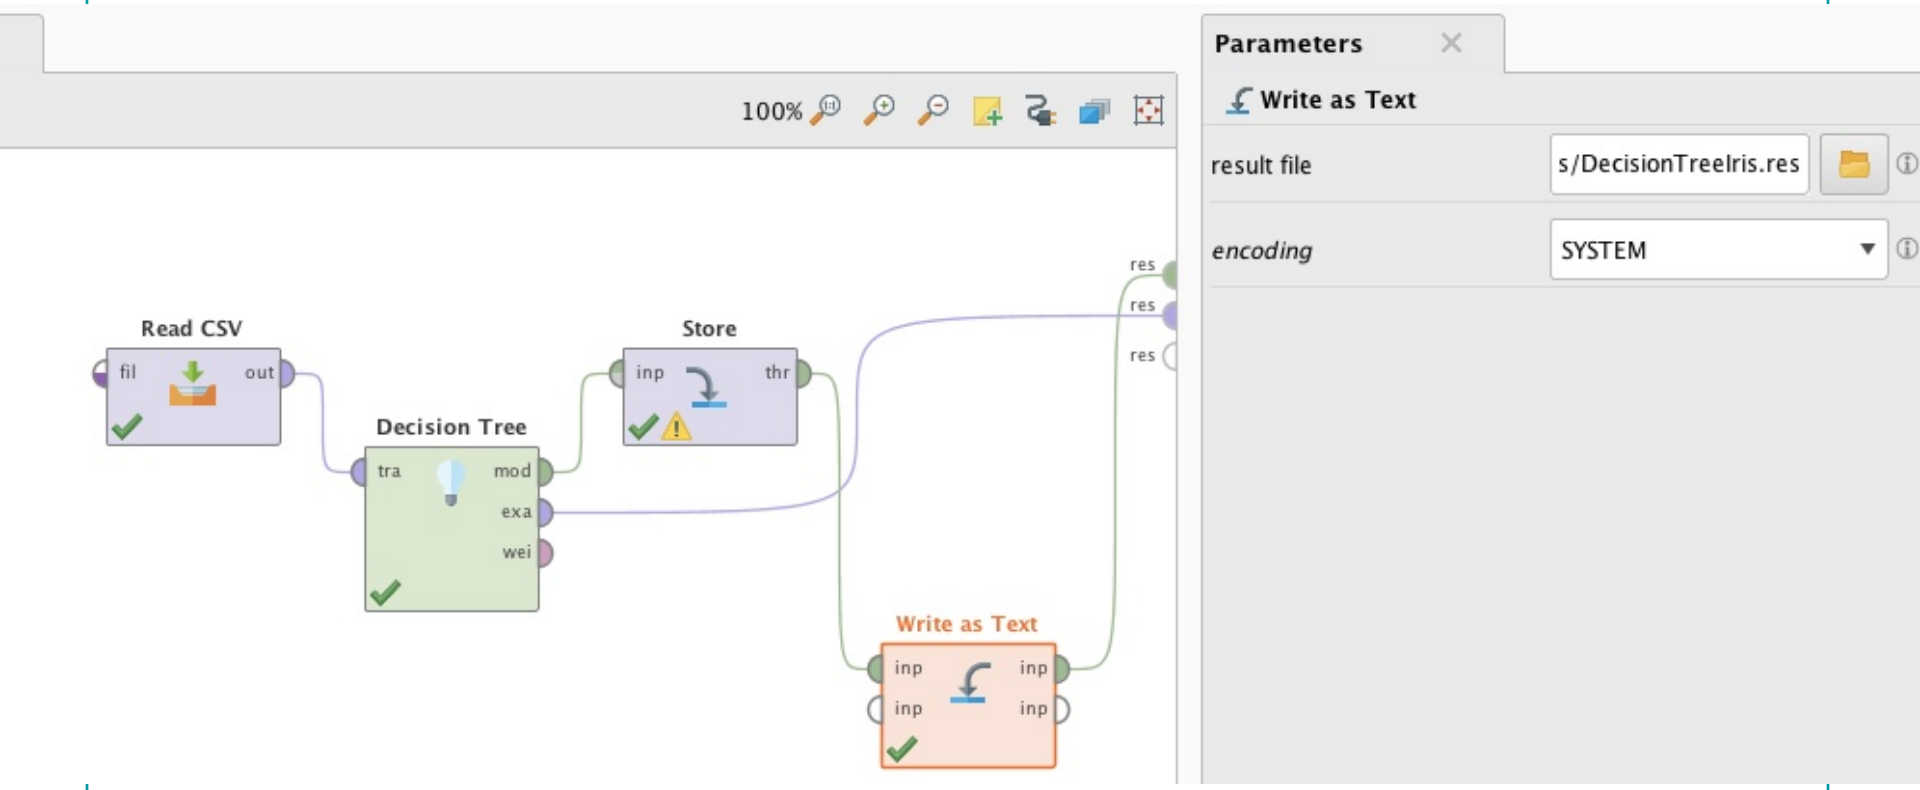
Classification with the iris dataset

Class should be of type Label



Classification

Decision tree:

- label to set the attribute to predict

Validation:

- X Validation Operator
- Handy: Write as Text Operator the output of Performance Operator to check the result step by step.
